Changing the held-out unit changes the evaluation

Tumor vs source-defined normal · six CPTAC cohorts · corrected labels, patient keys and protein identity

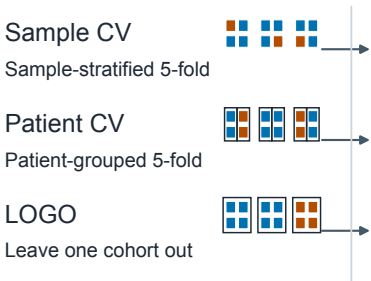
A Align the measured objects

1,191 samples
.C cored-normal corrected

719 patients
True patient keys

8,906 stable ENSP
Aligned protein abundance

B Change the split unit



C Compare the readouts

	Pooled AUROC	Pooled ECE
Sample CV	0.9942	0.0199
Patient CV	0.9944	0.0135
LOGO	0.9555	0.1100

LOGO macro AUROC 0.9343

ECE: expected calibration error

train test; grids are split cartoons, not actual folds

Confidence-ranked abstention changes who remains

100% coverage
Accuracy 0.8497

→

10% requested coverage
Accuracy 1.0000 (119/119)

107/119 retained samples are LUAD + LSCC; the retained cohort mix changes.

Cancer type × study confounded; all-six feature intersection uses target availability.

Protocol contrast, not target-blind deployment, a biological partition or a coverage guarantee.
